"Diabetes and Pregnancy. Prophylaxis: Glycemic Curve in Patients Delivering Enormous Fetus."

Warsaw, Polski Tygodnik Lekarski, Vol 18, No 36, 2 Sep 63, pp 1338-1340

Abstract: [Authors' English summary modified] Authors analyzed glycemic curve of 73 women who delivered enormous fetuses and classified them by height and shape of the curves. Normal hyperglycemic curves were found in 54, latent diabetis appearing during pregnancy -- in 3, and latent future diabetis -- in 16. Authors suggest that studies on the carbohydrate metabolism may be of great value in diagnosing diabetes and preventing complications. 1/1 25 refs: 5 Polish, 4 Gorman, 16 Western.

TITLE:

Investigation of 0.5- to 16-kev Electron Penetration Through
Collodion- and Gold Films

PERIODICAL:

Fizika tverdogo tela, 1959, Vol 1, Nr 8, pp 1250 - 1258 (USSR)

ABSTRACT:

The laws governing the penetration mentioned in the title were found by simultaneous investigation of film penetrability and electron energy distribution after their passage through the films of the substances to be investigated. The authors paid attention to the removal of secondary effects. Thin films (of various thickness) of the substances under investigation were bombarded with electrons. By slowing down the electrons having passed through the film in the field of a spherical capacitor it was possible to determine the integral distribution curves practically over all energies. These measurements allow the following conclusions: In collodion and gold films of various thickness the dependence of the extreme depth of penetration R on electron energy E obeys Bethe's law of specific loss.

$R = 77.5E^{1.3}$ holds for gold. The electron spectrum may be subdivided into two ranges corresponding to slow (from 0 to

Card 1/2

67311

Investigation of 0.5- to 16-kev Electron Penetration Through Collodion- and Gold Films SOV/181-1-8-16/32

100-150 ev) and fast (from 100-150 ev and above) electrons.²¹
 In all cases of primary electron energy and sample thickness the slow electrons form a considerable part of the total number of departed electrons. Slowing down and scattering of fast and slow electrons follow various laws. The law of energy loss by fast electrons reads $dE/dx = \text{const}$. Thus, the law of primary-electron slowing-down in gold is linear, at least in a certain interval of electron energies and film thicknesses. The authors thank A. R. Shul'man, in whose laboratory the present investigation was performed, and also the student Yu. M. Voron who assisted in the measurements. There are 11 figures and 14 references, 3 of which are Soviet.

TITLE: Electron scattering in thin copper and gold films

SOURCE: Fizika tverdogo tela, v. 8, no. 5, 1966, 1641-1643

TOPIC TAGS: particle scatter, electron scattering, copper film, microelectronic thin film

ABSTRACT: Conventionally prepared Cu (300-1500 Å) and Au (200-600 Å) films were used to examine the electron backscattering and the angular distribution of electrons in the 1.5 to 16 kev energy range. The obtained results are recorded on polar diagrams. Based on experimental data, it seems that in the course of multiple scattering, some electrons scatter at larger angles than other electrons. This may be a result of close interactions which are capable of abruptly changing the direction of motion of an electron. Moreover, it appears that the motion of the electron beam is not necessarily diffuse, as believed to be by other authors. The authors thank A. R. Shul'man for his continued attention and discussions of the work.

TITLE: Investigation of the penetration of 1-12 kev electrons through aluminium films

SOURCE: Radiotekhnika i elektronika, v. 9, no. 2, 1964, 321-332

TOPIC TAGS: electron penetration, aluminum penetration by electrons, penetrable aluminum film, 1-12 kev electron penetration, penetrated electrons formula

ABSTRACT: An experimental study of (a) the penetration of 12.5-178 microgram/cm² (500-7,100 Å) thick Al foils by 0.5-12-kev electrons and (b) the energy spectra of transmitted electrons is reported. Two experimental bulbs are described and their sketches supplied. Unlike H. Kanter's results (Phys. Rev., 1961, 121, 2, 461), almost entirely stopped electrons (with a 50 ev energy) were

Card 1/2

ACCESSION NR: AP4017603

observed past the Al film at critical energies of the incident electrons. It is shown that the electron range determined from the penetration curves refers to the stopped electrons. On the basis of experimental data obtained, this relation between the cross range of electrons and their energy is proposed: $R = 480 E^{1.5}$. However, it is hard to establish an agreement between this formula and the theory as the ratio l/d is unknown (l is the actual electron path in the film, d is the film thickness). The energy spectra measurements showed a wide spread in energy losses which does not agree with the well-known Bohr and E. J. Williams theoretical data developed for beta particles. ABSTRACT: The calculation of the critical speed of vertical sectional pumps is reduced to the calculation of the natural frequencies of the transverse oscillations of a straight real rod graduated rigidity, with a system of concentrated masses, and mounted on an elastic real supporting structure. The problem is solved by the use of a system of transmission matrixes, which is also convenient for computa-

P.A. Investigating the methods of purification used by A. Petit and M. Kainer, "When Barker asked us A. Petit and M. Kainer, 'What was your contribution to their Agriculture and Industry'?"

Vol IV, No. 7, pp. 29-33, July 1950

A process was elaborated for the manufacture of colder lactic acid taking into account the existing difficulties between equipment on this level. The first point was acid made which contains most of the lactic acid as calcium lactate ... is neutralized with lime and an equivalent amount of ammonium sulfate is added. The crystals that had been formed is removed together with the spent residue by filtering at 60-65°C. During its removal due to the poor solubility of ammonium lactate. After this the filtrate is evaporated, crystallized, redissolved in hot water, enriched with active carbon and desolved by adding lime milk. The calcium lactate remains in a dissolved state, the magnesium hydroxide is precipitated and recovered for further use by dissolving it in sulphuric acid. Final tests proved the solubility of this sulphuric acid. Five additional operational phases are required. Five additional operational phases are required for producing colder lactic acid by this method on commercial scale. The present preparation of technical lactic acid, however, this however in the cost of production is simply compensated by the quality of the product, a 50 per cent colder lactic acid. It is important that the current process coming into contact with pure lactic acid for continuous treatment. The existing lactic acid distilling process is considered the most suitable method for preparing chemically pure lactic acid.

Title : Conditions of Solubility in a System of Alcohol-Water-Fusel Oil and a New Method of Drawing-Off Fusel Oil.

Orig Pub : Elem. ipar, 1957, 11, No 5-6, 138-142

Abstract : The scheme of rectification of alcohol is simplified. Separation of fusel oil (FO) is accomplished in a special decanter connected in a line that joins above the first and below the second column. For determining the optimum concentration of the FO being recycled, curves were obtained for its solubility in a triple system of alcohol-water and C_2H_5OH (or C_4H_9OH), at 20° and boiling temperature ($80-94^\circ$ depending on the composition). During the development of

• Kaniewski K. An Outline of the Genetical Structure of Wheat Varieties.

"Zarys struktury genetycznej gatunków pszenicy". Warszawa, 1953. Państw. Zdz. Hod. Roln., 199, 101 pp., 32 figs., 13 tabs.

Results of studies carried out by the author relating to the genetics of *Triticum* species forms. The studies were conducted on crosses of tetraploid and hexaploid species. Independent inheritance of a certain number of features in varieties of wheat species was confirmed. A number of new long named varieties were determined. The relationship between *T. turgidum* and *Triticum durum* was finally established as well as, in certain cases, the range of influence of the so-called basic factors affecting the fundamental determinations of awns and spikelets and simultaneously affecting a number of minor characteristics.

The course of this reflex is discussed: nervus medianus-tractus spinothalamicus-thalamus opticus, substantia nigra - on the heterolateral side; the further course of the stimulus leads on the other side to the nucleus of the facial nerve. This sub-cortical reflex indicates a lesion of the tractus thalamo-corticalis, tractus cortico-bulbaris or of the cortex especially in the motor area. The presence of this reflex in functional disturbances indicates a cortical inhibition. Herman - Łódź (VIII,2*)

AUTHOR: Kaninos, V. M.

TITLE: Heat transfer on free rotation of a non-uniformly heated disk

PERIODICAL: Inzhenerno-fizicheskii zhurnal, v. 6, no. 3, 1963, 12 - 20

TEXT: L. A. Dorfman (IFZh, no. 6, 1958) demonstrated the important effect of a radial temperature gradient on the heat transfer intensities of a rotating disk. Here theoretical results are compared with local and mean heat transfer coefficients determined on a freely rotating disk (690 mm in diameter, 20 mm thick, 250 - 2650 r.p.m.), heated by a peripheral electric heater. The radial temperature distribution was measured by nine thermocouples; they were lead through a hollow rod and connected to the measuring circuit by means of copper rings and graphite-copper brushes. In the case of a laminar gas flow the heat transfer as a function of Re may be described by $Nu_M = 0.465Re^{0.5}$; in the case of a turbulent flow

$Nu_M = 0.0244Re^{0.8}$. $Nu_M = \alpha_M r / \lambda_r$, α_M is the local heat transfer factor.

The divergence between these experimental results and the theoretical relations is 6 - 7 %. The formulas $Nu_M = f(Re)$ and $Nu = f(Re)$ given by Card 1/2

3/170/63/006/003/002/014
B104/B186

Heat transfer on free rotation ...

Dorfman are generalized by avoiding the assumption of a given temperature distribution function and by introducing the one-dimensional heat conduction equation $t = Ar^{\xi}$, $\xi = -1 \pm \sqrt{1 + 2\alpha s/\lambda}$, into the problem. The Nusselt number is found to be a function of Re , Pr , λ_r/λ , r/y . In the experiments carried out, $Pr = \text{const}$, $\lambda_r/\lambda \approx \text{const}$. Therefore the relation

$Nu = f(Re, \delta/r)$ was sought for $Nu_M = 0.0135Re^{0.8}(r/\delta)^{0.2}$,

$Nu = 0.0064Re^{0.8}(r/\delta)^{0.4}$. The equations $Nu_M/Nu_M^0 = 3.22 (r\lambda_r/\delta\lambda)^{0.2}$ and

$Nu/Nu^0 = 8.74 (r\lambda_r/\delta\lambda)^{0.4}$ make it possible to estimate the influence of the radial temperature gradient on the heat transfer of a rotating disk in a turbulent flow. As a result of the non-uniform temperature distribution, the mean heat transfer coefficient of thin disks of aviation jet engines is twice as great as that of disks having a uniform temperature distribution. There are 4 figures. ✓

Title : Kłodav Potassium Salts.

Orig Pub : Chemik, 10, No 7-8, 199-202 (1957) (in Polish)

Abstract : By their phase composition the salts investigated appear to be mixed and have been shown to contain halite, carnallite, sylvinit, kieserite with small amounts of anhydrite, mud, and in certain horizons, langbeinite. Carnallite appears to be the main mineral. The chemical composition of a number of characteristic samples is given. The deposit is of great commercial importance.

TITLE: Propagation of correlation tensors of the electromagnetic field intensities

SOURCE: Acta physica polonica, v. 29, no. 6, 1966, 735-741

TOPIC TAGS: tensor, electromagnetic field, magnetic field intensity, signal correlation

ABSTRACT: The paper deals with the problem of propagation of physical quantities describing the correlations between electromagnetic field states at different points in space and different instants of time. Formulas are derived for the propagation of analytical signals $\vec{E}(\vec{x}, t)$ and $\vec{H}(\vec{x}, t)$ connected with the intensities of the electric and magnetic fields, and from these formulas the propagation of the correlation tensors is calculated. The dependence of the correlation tensor at two arbitrary points of space on values of the correlation tensors and on values of their first and second time derivatives on the surface surrounding both points is derived. The author is much indebted to Professor B. Karozowski for suggesting this work and for help during its course. Orig. art. has: 8 formulas.
